

Customer Information on Conflict Minerals

Conflict minerals include coltan (Nb, Ta), cassiterite (Sn), wolframite (W) and gold (Au), as well as the fine metals derived from them, which originate in the Democratic Republic of the Congo and neighbouring countries. The sale of these raw materials finances armed conflicts in these regions, violates human rights and also damages the environment during extraction.

For the most part, recycled materials are used for the production of our aluminium profiles, which are generally classified as conflict-free according to the regulations of the American Congress (Dodd-Frank Act).

For the remaining raw material content, Thöni Industriebetriebe uses pure aluminium and alloy components, for which we can rule out the presence of conflict minerals to the best of our knowledge and belief.
